LESSON 1.3 | Lesson notes

Why Use Python with a Database?

Overview

Python can talk to a database, send it commands written in SQL and use the answers inside a program. This lets you build programs whose data survives after they close: a to-do list that remembers tasks, a shop that stores orders or a report that reads yesterday's sales. Python includes the sqlite3 module, so you can create a complete database in a single file without installing a server. In this course you will use sqlite3 to practise every idea, and the same ideas carry over to larger systems.

Key points

- Part of: Introduction to Databases
- About 15 minutes
- Try the example yourself, then check it

How to use this handout

1. Read the overview first, then work through the key points in order.
2. Write down anything you are unsure about and ask in the course forum.
3. Use page 2 to plan your practice and keep notes.

LESSON 1.3 | Lesson notes

Why Use Python with a Database?

Practice checklist

- [ ] Read: Why Use Python with a Database?
- [ ] Try the example from the lesson
- [ ] Explain the main idea in your own words
- [ ] Answer the related questions
- [ ] Ask about anything unclear in the forum
