LESSON 3.1 | Lesson notes

# Connecting with sqlite3

## Overview

Import the sqlite3 module and call sqlite3.connect with a file name, for example conn = sqlite3.connect("school.db"). If the file does not exist, SQLite creates it. The connection object represents the database; from it you create a cursor with conn.cursor(), which is what runs commands and fetches results. When your changes are finished, call conn.commit() to save them and conn.close() to release the file. Using the connection in a with block commits or rolls back automatically.

## Key points

- Part of: Python and SQLite
- About 15 minutes
- Try the example yourself, then check it

## How to use this handout

1. Read the overview first, then work through the key points in order.
2. Write down anything you are unsure about and ask in the course forum.
3. Use page 2 to plan your practice and keep notes.

LESSON 3.1 | Lesson notes

# Connecting with sqlite3

## Practice checklist

- [ ] Read: Connecting with sqlite3
- [ ] Try the example from the lesson
- [ ] Explain the main idea in your own words
- [ ] Answer the related questions
- [ ] Ask about anything unclear in the forum

## My notes
